ADVACED SUB ARRAY PROBLEM

Description You are competing in a basketball contest. In this contest the score for each successful shot depends on both the distance from the basket and the player's position. The ball is shot N times, successfully. You are given an array A containing the distance of a player from basket for N shots. The index of array represents the position of the player. Score is calculated by multiplying the position with the distance from the basket.

Your task is to find and return an integer value, representing the maximum possible score you can achieve by choosing a contiguous subarray of size K from the given array.

## Note:

- \* A subarray is a contiguous part of array.
- \* Assume 1 based indexing.
- \* The array contains both negative and positive values.

5000

\* Assume the player is standing on a cartesian plane.

## **Input Format**

- input1:An integer value N representing the number of shots made by the player
- **input2** : An integer K representing the size of subarray
- input3 : An array of integers

## Sample Input

ANT ON RAIL

## **Description**

There is a ant on your balcony. It wants to leave the rail so sometimes it moves right and sometimes it moves left until it gets exhausted. Given an integer array A of size N which consists of integer 1 and -1 only representing ant's moves.

Where 1 means ant moved unit distance towards the right side and -1 means it moved unit distance towards the left . Your task is to find and return the integer value representing how many times the ant reaches back to original starting position.

## Note:

- Assume 1-based indexing
- Assume that the railing extends infinitely on the either sides

## **Input Format:**

**input1**: An integer value N representing the number of moves made by the ant.

**input2**: An integer array A consisting of the ant's moves towards either side

## Sample Input

5

1 -1 1 -1 1

## **Sample Output**

2

## **Source Code:**

```
n=int(input())
arr=list(map(int,input().split()))
summ=0
count=0
for i in range(len(arr)):
    summ+=arr[i]
    if summ==0:
        count+=1
print(count)
```

Title

CHOCOLATE JAR

## Description

You are given an integer array of size N, representing jars of chocolates. Three students A, B, and C respectively, will pick chocolates one by one from each chocolate jar, till the jar is empty, and then repeat the same with the rest of the jars. Your task is to fine and return an integer value representing the total number of chocolates that student A will have, after all the chocolates have been picked from all the jars.

Note: Once a jar is done A will start taking the chocolates from the new jar.

.0

## **Input Format:**

**input1:** An integer value N representing the number of jars.

**input2:** An integer array representing the quantity of chocolates in each jar.

## **Output Format:**

Return an integer value representing the total number of chocolates that student A will have, after all the chocolates are picked.

## **Example:**

## Input:

3

10 20 30

## **Output:**

21

## **Explanation:**

Jar 1: 10 chocolates -> A-4, B-3,C-3

Jar 2: 20 chocolates -> A-7, B-7, C-6

Jar 3: 30 chocolates -> A-10, B-10, C-10

so A gets a total of 4+7+10=21 chocolates.

## **Source Code:**

```
n=int(input())
    arr=list(map(int,input().split()))
    summ=0
    for i in arr:
        if i%3==0:
            summ+=(i//3)
        elif i%3>0:
            summ+=(i//3)+1

DIWAL CONTEST

**Description** 

Max is planning to take part in a Diwali contest at a Diwali Party that will begin at 8 PM and will run until midnight (12 AM) i.e., for 4 hours. He also needs to travel to the party venue within this time which takes him **P** minutes. The contest comprises of **N** problems that are arranged in order of difficulty, with problem 1 being the simplest and problem N being the most difficult. Max is aware that he will require 5\*i minutes to solve the i<sup>th</sup> problem.

ST T

UBZ

000.

CSEC

Your task is help Max find and return an integer value, representing the number of problems Max can solve and reach the party venue within the given time frame of 4 hours.

Note: Max will leave his home at exactly 8 PM to reach the party venue.

## **Input Format:**

input1: An integer value N, representing the total number of problems.

input2: An integer value P, Representing the time to travel in minutes from his home to the party venue.

## **Example:**

## Input:

6

180

## **Output:**

4

## **Explanation:**

The amount of time left to solve the problems is 4\*60-180=60 mins.

1st Problem - 5 mins, Time left = 60-5=55 mins

2nd Problem - 10 mins, Time left = 55-10=45 mins

3rd Problem - 15 mins, Time left = 45-15=30 mins

4th Problem - 20 mins, Time left = 30-20=10 mins

5th Problem - 25 mins

THE STATE OF THE S

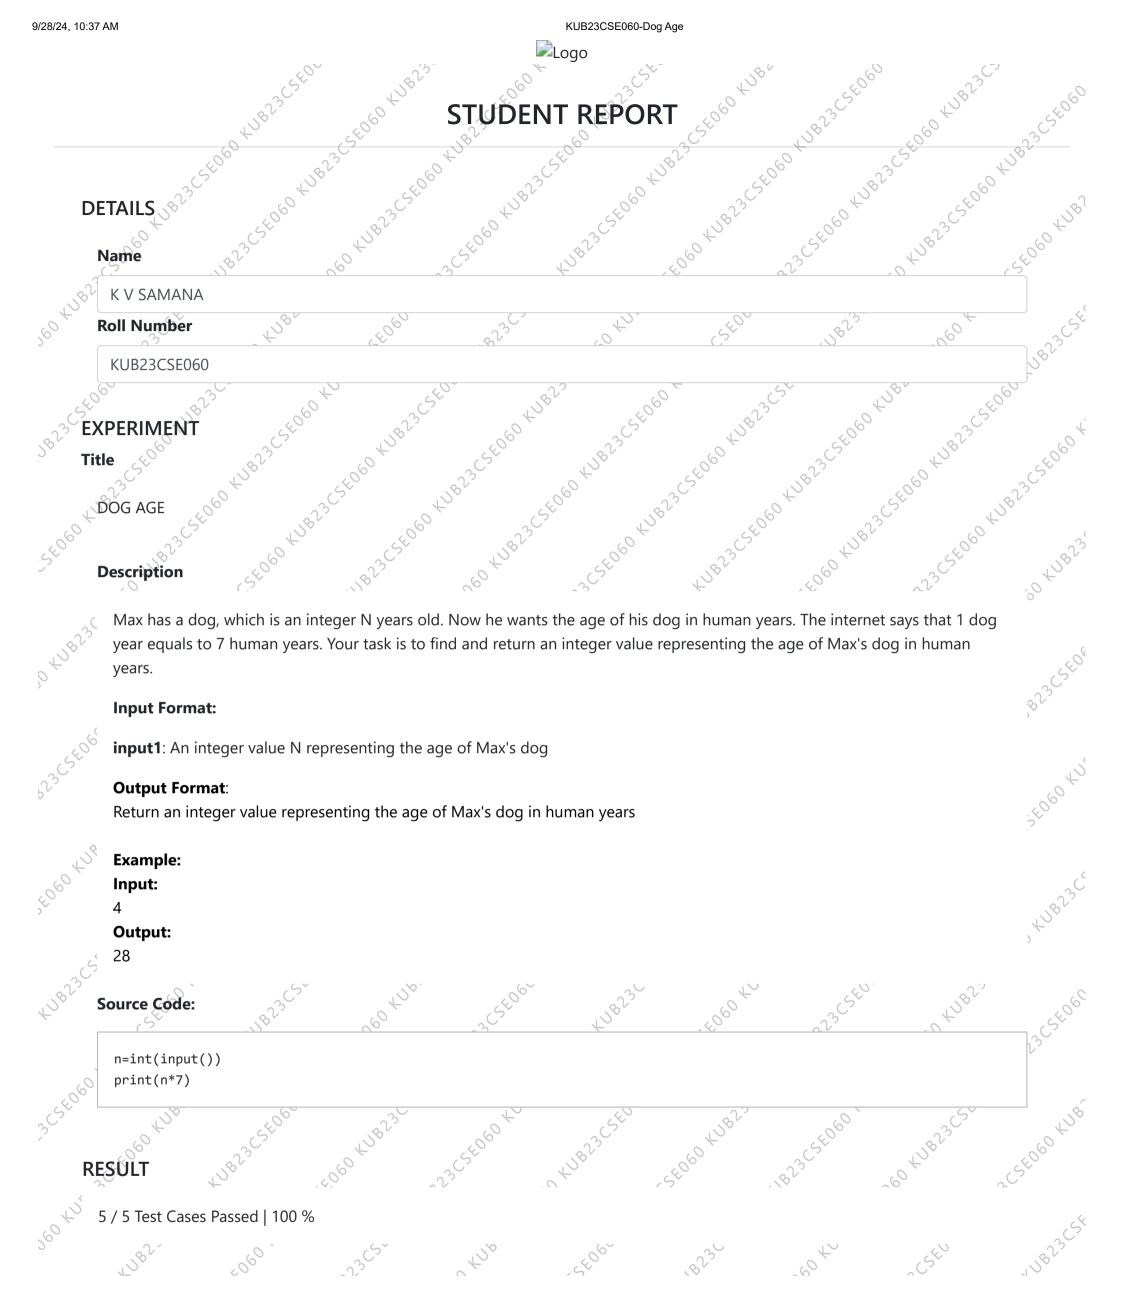

9/28/24, 10:36 AM KUB23CSE060-Diwali Contest

So he can solve only 4 problems as he is not left with 25 mins to complete 5th problem.

SUM OF NUMBERS AT PRIME FACTORS

## Description

Prime factors of a positive integer are the prime numbers that divide that integer exactly.

Given an array arr of n integers and a positive integer num.

Let's suppose prime factorization of num is:  $p^a \times q^b \times r^c \times .... \times z^f$ , where p,q,r...z are prime numbers.

Sum of numbers in array arr at indices of prime factors of number num is: a x arr[p] + b x arr[q] + c x arr[r] +..... + f x arr[z].

You are given an array arr of size n and a positive integer num. You are required to calculate the sum of numbers in arr as mentioned above, and print the same.

Note:

- If arr is empty, print -1.
- If prime factor of num not found as indices, print 0.

## **Input Format:**

The input consists of three lines:

- The first line contains an integer, i.e. n.
- The second line contains an array arr of length of n.
- The third line contains an integer num

The input will be read from the STDIN by the candidates.

Output Format:

Print the sum that was mentioned in the problem statement.

Example:

Input:

6

11 21 32 45 1 23

6

Output:

77

Explanation:

```
Source Code:

def count_spaces(S):
    return S.count('')

# Example usage
S =input()
space_count = count_spaces(S)
print(space_count)

NUMBER OF COMBINATIONS LEADING TO A PRODUCT

## Description

Problem Statement:

You are given an array arr and a product m. Your task is to find the number of possible unique triplets whose product of elements is m.

## Input Format:

- The first line contains the integer, n
- The second line contains space seperated integers of the array, arr
- The third line contains the product m.

The input will be read from the STDIN by the candidate

Output Format:

The output consists of a single integer, i.e. the count of unique triplets having product m.

The output will be matched to the candidate's output printed on the STDOUT

Example:

Input:

7

5 3 20 10 1 4 2

60

Output:

3

Explanation:

Product m:60

Possible triplets for product m: (5,4,3),(20,3,1), (10,3,2)

The count of unique triplets is 3.
